

AI-POWERED SERVICE DESK

DigiPlus Technical Assessment • Duration: 3.5 Hours

Problem Statement

Support teams receive technical issues in natural language and need to quickly understand, priorities and resolve them. You need to build a small application that uses AI to assist a support engineer in handling such issues. The solution should allow a user to submit an issue, manage its lifecycle, and obtain useful AI-assisted information for investigation and resolution.

Basic Requirements

- Create and persist the support incidents/issues.
- View and manage existing incidents.
- Auto analyze an incident and provide meaningful assistance.
- Maintain a small knowledge base or equivalent support information.
- Use AI to connect incidents with relevant support information.
- Record the outcome/resolution.
- Include appropriate validation and error handling.

Support Ticket Data Source:

AI Requirement

AI must be a meaningful part of the solution. The model/provider, prompts, data flow and implementation are your choice. Do not rely entirely on hard-coded rules to simulate AI behavior.

Your Approach

UI, architecture, technology stack, database schema or API design are not prescribed. Make your own technical decisions. Different implementations and approaches are encouraged.

Optional Enhancements

Examples include conversational AI, similar/duplicate incident detection, intelligent search, automatic categorization, analytics, authentication, notifications, testing, containerization, or any other feature you believe adds value.

Submission

Submit source code and a README with setup/run instructions, AI configuration, a short explanation of your approach, assumptions and known limitations.

Assessment Focus

Area	Focus
Functionality	Working and coherent solution
AI	Appropriate use, reasoning and reliability
Engineering	Design, code quality and maintainability
Data	Persistence and sensible data handling
UX	Clarity and usability
Problem solving	Technical decisions, trade-offs and originality

AI coding assistants may be used. You must be able to explain your implementation and decisions.
